CONSTRUCTION MATERIALS / PRACTICE 1b

QUESTION 3

Aggregate sample was taken from a stockpile at a ready mixed concrete plant and the mass and the volume of the sample were measured as 680 g and 500 cm³, respectively. After drying, the oven dried mass was measured as 660.2 g and the water absorption rate of the aggregate was determined as 1.2%. 920 kg of aggregate from the same stockpile will be used in 1 m³ of concrete batch. Considering the excess water on the aggregate surface calculate the reduction in the mixing water.

$$W_H = 680 \text{ g} \quad V_H = 500 \text{ cm}^3 \quad W_{OD} = 660.2 \text{ g} \quad a_m = 1.2 \%$$

$$W_O = W_{OD} \times (1 + 0.012) \rightarrow W_O = 668.1 \text{ g}$$

Moisture Content H%

$$H\% = \frac{W_H - W_O}{W_O} \times 100 = \frac{680 - 668.1}{668.1} \times 100 \cong 1.8 \%$$

$$W_H = 920 \text{ kg} \quad \rightarrow \quad W_O = \frac{920}{1 + 0.018} = 903.7 \text{ kg}$$

Excess water in 920 kg of moist aggregate

$$\Delta W = \text{excess water} = 920 - 903.7 = 16.7 \text{ kg}$$

QUESTION 4

The sieve analysis was performed on three groups of dry aggregates and the results are given below. According to the test results:

- a) Calculate the percentage passing (P%) of each aggregate.
- b) Find the appropriate mix ratio of each aggregate provided that the half of the aggregate in the mixture is coarser than 4 mm and 1/3 of the aggregate in the mixture is finer than 1 mm.
- c) Check the conformity of the mixing values to the limit values of the reference curves.
- d) Plot the grading curve of each aggregate and also the mix aggregate (4 curves in total) on the same graph.
- e) Calculate the fineness modulus of the mix aggregate.

| 0.15 | 190 | 140 | 14 | 0 | 0 | 0 | 0 | 0 | 0 | 5.6 | 94.4 | 3 | 7 | 11 |
| Ratio in the mix | 39.9% | | | 32.6% | | | 27.5% | | | $\Sigma =$ | 499 | | | |

b) According to the given constraints find the mixing ratios of aggregates

$$a + b + c = 100\%$$

$$P_{m,4} = 100a + 31b + 0c = 50$$

$$P_{m,1} = 77a + 7b + 0c = 33$$

By using three equations mixing ratios of the aggregates can be calculated.

$$a = 39.9\% \quad b = 32.6\% \quad \text{and} \quad c = 27.5\%$$

c) $\boxed{\Sigma a_i\% = 100\%}$ and $\boxed{P_{\text{mix},d} = a_1.P_{1,d} + a_2.P_{2,d} + a_3.P_{3,d} + \dots}$

$$P_{m,31.5} = 100.0.399 + 100.0.326 + 100.0.275 = 100 \rightarrow \text{Check: } A_{16,31.5} = 100 \leq 100 \leq C_{16,31.5} = 100 \quad \checkmark$$

$$P_{m,22.4} = 100.0.399 + 100.0.326 + 100.0.275 = 100 \rightarrow \text{Check: } A_{16,22.4} = 98 < 100 \leq C_{16,22.4} = 100 \quad \checkmark$$

$$P_{m,16} = 100.0.399 + 97.0.326 + 86.0.275 = 95.2 \rightarrow \text{Check: } A_{16,16} = 85 < 95.2 < C_{16,16} = 99 \quad \checkmark$$

$$P_{m,11.2} = 100.0.399 + 88.0.326 + 40.0.275 = 79.6 \rightarrow \text{Check: } A_{16,11.2} = 68 < 79.6 < C_{16,11.2} = 90 \quad \checkmark$$

$$P_{m,8} = 100 \cdot 0.399 + 59 \cdot 0.326 + 18 \cdot 0.275 = 64.1 \rightarrow \text{Check: } A_{16,8} = 48 < 64.1 < C_{16,8} = 77 \quad \checkmark$$

$$P_{m,4} = 100 \cdot 0.399 + 31 \cdot 0.326 + 0 \cdot 0.275 = 50.0 \rightarrow \text{Check: } A_{16,4} = 33 < 50.0 < C_{16,4} = 64 \quad \checkmark$$

$$P_{m,2} = 86 \cdot 0.399 + 15 \cdot 0.326 + 0 \cdot 0.275 = 39.2 \rightarrow \text{Check: } A_{16,2} = 22 < 39.2 < C_{16,2} = 52 \quad \checkmark$$

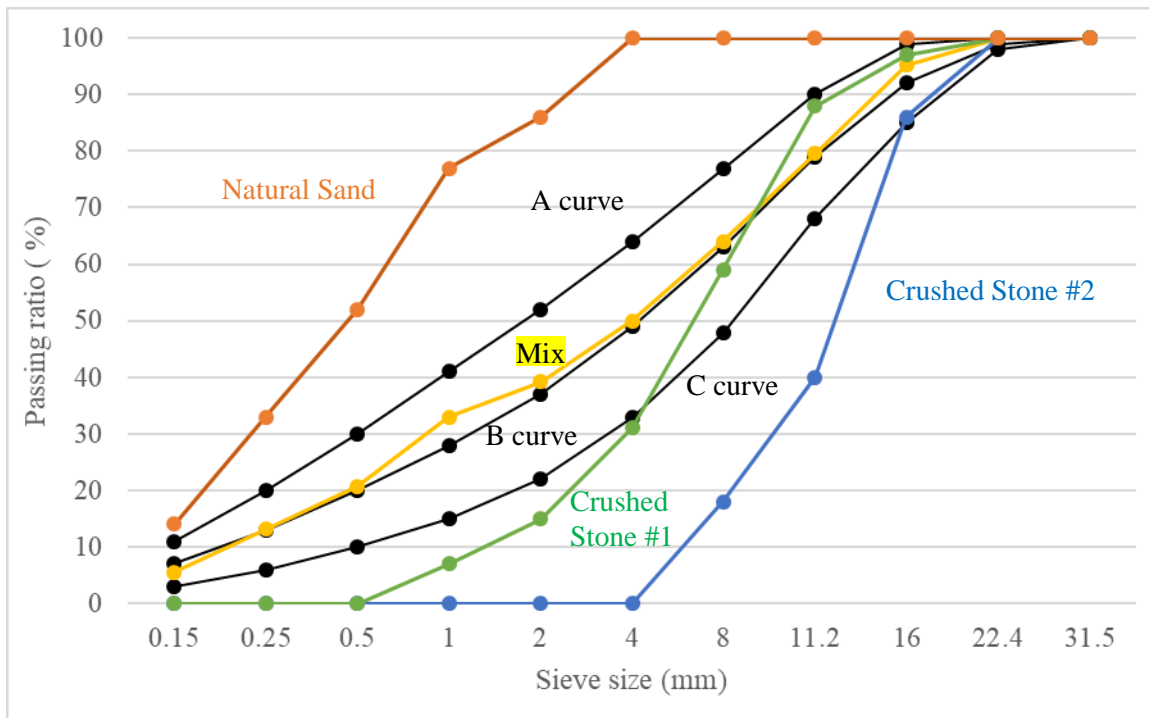

$$P_{m,1} = 77 \cdot 0.399 + 7 \cdot 0.326 + 0 \cdot 0.275 = 33.0 \rightarrow \text{Check: } A_{16,1} = 15 < 33.0 < C_{16,1} = 41 \quad \checkmark$$

$$P_{m,0.5} = 52 \cdot 0.399 + 0 \cdot 0.326 + 0 \cdot 0.275 = 20.7 \rightarrow \text{Check: } A_{16,0.5} = 10 < 20.7 < C_{16,0.5} = 30 \quad \checkmark$$

$$P_{m,0.25} = 33 \cdot 0.399 + 0 \cdot 0.326 + 0 \cdot 0.275 = 13.2 \rightarrow \text{Check: } A_{16,0.25} = 6 < 13.2 < C_{16,0.25} = 20 \quad \checkmark$$

$$P_{m,0.15} = 14 \cdot 0.399 + 0 \cdot 0.326 + 0 \cdot 0.275 = 5.6 \rightarrow \text{Check: } A_{16,0.15} = 3 < 5.6 < C_{16,0.15} = 11 \quad \checkmark$$

d)

e) Fineness Modulus: $F_m = \Sigma(100 - P_i\%) / 100$

$$F_{m,mix} = \Sigma(100 - P_{mix}\%) / 100 = 499 / 100 = 4.99$$
